What is a battery pack design?

The basic explanation is how the battery cells are physically connected in series and parallel to achieve the desired power of the pack. Check out this design guide, Custom Battery Pack Design Guide - Manufacturing Capabilities. The physical layout of the configurations is typically designed to fit within a desired dimensional space.

How do battery pack configurations work?

Battery pack configurations can be designed with several options, some of which are determined by the chemistry, cell type, desired voltage and capacity, and dimensional space constraints. The basic explanation is how the battery cells are physically connected in series and parallel to achieve the desired power of the pack.

What is the best interconnect material for a battery pack?

Pure nickel buss material (and spot welding to assemble) is the most common interconnect method. However, when a design requires high pack amperage, the buss material becomes another critical factor for the design. Learn more about how to select your battery pack cell type. There are an infinite variety of battery pack combinations.

How do you calculate a cubic battery pack?

Cubic packing is in neat rows. The size of such a pack is  $nD \times mD \times H$ , where  $n$  is the number of cells in a row,  $m$  is the number of rows,  $D$  is the cell diameter, and  $H$  is the cell height. Photo of completed multiple row configured cells battery pack below:
