

Base station battery cost calculation

How are the costs of a complete battery system calculated?

The costs of a complete battery system, based on cathode active material price scenarios calculated in the work, are represented by a linear regression that accounts for economies of scale. The costs for the battery system were differentiated into cost types, but not into process steps.

How many base stations and backup battery features are there?

In this paper, we closely examine the base station features and backup battery features from a 1.5-year dataset of a major cellular service provider, including 4,206 base stations distributed across 8,400 square kilometers and more than 1.5 billion records on base stations and battery statuses.

How do you calculate the cost of a car battery?

Several secondary materials, such as the anode, separator, and electrolyte are incorporated into the cost considerations. The main methodology follows the identification of the estimated weights for each car type and battery multiplied with the costs in USD per kilogram of the used material.

How many battery groups does a base station have?

The original battery allocation result is largely skewed that over 65 percent base stations are equipped with only one battery group. Our framework considers both the base station situations and battery features, allocating 2 battery groups to most base stations and 3 or 4 battery groups to those with long-time power outages.
