

Condensation in the solar battery cabinet compartment

How to prevent water condensation inside an enclosure?

An ideal way to prevent water condensation inside any enclosure is to prevent moisture getting inside the enclosure in the first place. However, in real life, this kind of protection is not always possible and we need to have other ways in which we can prevent condensation from forming.

How do you prevent condensation in a cabinet?

Reduce relative humidity inside a cabinet after initial commissioning. Drive humid air out of a cabinet through vents. Prevent condensation from forming on internal cabinet walls/ceiling. Prevent condensation on internal metal parts when the external ambient gets hotter.

How do I prevent condensation on internal metal parts?

Prevent condensation on internal metal parts when the external ambient gets hotter. Pre-heat an electrical cabinet prior to operation (if the minimum operating temperature is not met) and protect the electronics during operation in low ambient temperatures. Maintain active parts at higher-than ambient temperatures during standby.

How do you prevent condensation on a heat sink?

Use of a coolant heater. Reduce localized relative humidity inside or near the power module after commissioning and when restarting after a long period of idle operation before applying voltage. Prevent condensation on the heat sink when the internal cabinet air temperature is hotter than the heat sink.
