

Energy storage cabinet charging and discharging test safety

What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

What is battery capacity testing?

Capacity testing is performed to understand how much charge /energy a battery can store and how efficient it is. In energy storage applications, it is often just as important how much energy a battery can absorb, hence we measure both charge and discharge capacities.

What is a stored energy test?

The goal of the stored energy test is to calculate how much energy can be supplied discharging, how much energy must be supplied recharging, and how efficient this cycle is. The test procedure applied to the DUT is as follows: Specify charge power P_{cha} and discharge power P_{dis} Preconditioning (only performed before testing starts):

How can UL help with energy storage problems?

We work with system integrators and OEMs to better understand and address energy storage systems issues. UL can test your large energy storage systems (ESS) based on UL 9540 and provide ESS certification to help identify the safety and performance of your system.
