

# How to calculate the weight of base station energy storage batteries

How do I choose a Bess battery?

When designing and selecting a BESS the project engineer will deal with a battery specialist who will try to select the correct battery package for the application. This will involve creating a usage profile for the system, with an assumed program of charge and discharge cycles.

What is a battery and how does it work?

However, the "battery" is often used as a general term to refer to a common collection of battery arrays. The lithium-ion interface unit will make a cell. The electrochemical reaction inside this cell generates a voltage that is typically in the range of 2.2 - 4.4 volts at the extremes of SOC.

How to optimize Bess capacity & power?

An exhaustive search method is employed to perform the BESS capacity (QESS) and power (PESS) optimization. The sizing process involves two distinct steps.

How long does a battery last?

As an example, this may include 300 events of charge discharge cycles from 60-40 % SOC at 1 C, with 5 events every year where the battery will act as spinning reserve, discharging at 2 C from 80 - 20 %, and one event in 5 years where the battery discharges from 90 - 10 % at 2 C. all this is considered over a design life of 10 years.
