What is a solar substation?

In large-scale solar projects, substations serve as a vital link between solar farms and the electrical grid. Solar power plants, especially those on a utility scale, can range from 50 MWp to over 500 MWp, producing vast amounts of electricity. October 24, 2024. By News Bureau

Why do solar power plants need a substation?

Reactive Power Compensation: Solar power plants can impact the balance of reactive power in the grid. Substations help regulate this through capacitors and reactors, maintaining voltage stability and reducing transmission losses.

What is a substation & why do we need one?

Substations are the backbone of power transmission infrastructure, converting and distributing electricity generated by solar farms to the grid. This article explores the pivotal role of substation solutions in large-scale solar power projects and discusses the challenges and innovations that are shaping the future of solar energy transmission.

What is a modular solar substation?

These substations are preassembled off-site and delivered to the solar farm for quick installation, reducing construction time and labour costs. Additionally, modular substations are highly scalable, making them ideal for projects that may need to expand capacity over time.
