What is a solar charge controller voltage?

Common system voltage levels are 12V, 24V, or 48V. This is the peak output current your solar panels or array can produce. Essentially, it's the maximum power your system can provide during the most effective solar energy periods. This is the highest current level that your solar charge controller can safely manage.

How do I set up a solar charge controller?

Here's a general outline of how to set up your solar charge controller: Begin with Proper Wiring: Kickstart your setup process by connecting the charge controller to your battery bank and solar panels. Make sure to follow the manufacturer's instructions to wire everything correctly.

What voltage settings do I need for a solar charge controller?

Here's a breakdown of the most important voltage settings for the solar charge controller: Absorption Duration: You can choose between Adaptive (which adjusts based on the battery's needs) or a Fixed time. Absorption Voltage: Set this to 14.60 volts. Automatic Equalization: You can disable this or set it to equalize every certain number of days.
