Can a battery hybrid energy storage system optimize a marine battery system?

For some marine applications, battery systems based on the current monotype topologies are significantly oversized due to variable operational profiles and long lifespan requirements. This paper deals with the battery hybrid energy storage system (HESS) for an electric harbor tug to optimize the size of the battery system.

Can a harbor tug be used as a battery hybrid energy storage system?

Abstract-- This paper deals with the optimal sizing and cost assessment of onboard battery hybrid energy storage system (HESS) for full-electric marine applications. In this regard, a harbor tug is selected as the use case and the cost of different full-active HESS topologies is compared against a baseline topology with a single type battery.

What is battery hybrid energy storage system (Hess) for an electric harbor tug?

This paper deals with the battery hybrid energy storage system (HESS) for an electric harbor tug to optimize the size of the battery system. The impact of battery hybridization weight. The design life of the battery system is considered to be 10 years, and NMC and LTO cell

What is a battery hybrid energy storage system (Hess)?

In this respect, a battery hybrid energy storage system (HESS) has been developed, composed of HE and HP battery technologies. The HESS provides an excellent solution to cover a wide range of energy and power requirements that can lead to a lower cost, higher overall efficiency, and longer lifetime in comparison with the monotype battery systems.
