

Restore the solar system

Why is Solar System Research important?

Solar System research is essential for understanding the origin and evolution of planets, along with the conditions necessary for life. Center for Astrophysics | Harvard & Smithsonian scientists study the Solar System in many ways: Participating in current and next-generation astronomical surveys mapping a large part of the sky.

Could planets survive if the Sun dies?

"The system we've discovered is a glimpse into the possible future of the Solar System," says Blackman. While the dying Sun will likely take out the terrestrial planets, the outer planets could well survive. "This is the first time one of these planets in a similar orbit to Jupiter has been found," he says.

How do scientists study the Solar System?

Center for Astrophysics | Harvard & Smithsonian scientists study the Solar System in many ways: Participating in current and next-generation astronomical surveys mapping a large part of the sky. The multi-year Pan-STARRS survey has revealed many comets, asteroids, and other small Solar System bodies.

Where is our Solar System located?

Our solar system is located in the Milky Way, a barred spiral galaxy with two major arms, and two minor arms. Our Sun is in a small, partial arm of the Milky Way called the Orion Arm, or Orion Spur, between the Sagittarius and Perseus arms. Our solar system orbits the center of the galaxy at about 515,000 mph (828,000 kph).

It's only a matter of time before humans begin extracting resources in large quantities from space, and we need to protect a portion of our solar system as wilderness before that happens, says...

Astronomers believe it formed about 4.5 billion years ago, when a massive interstellar cloud of gas and dust collapsed on itself, giving rise to the star that anchors our solar system--that big...

"The system we've discovered is a glimpse into the possible future of the Solar System," says Blackman. While the dying Sun will likely take out the terrestrial planets, the outer planets could ...

The centuries-long search to understand our Solar System's stability could now be over, or maybe not.

Lawrence Livermore National Laboratory (LLNL) scientists set out to reconstruct these original formation locations by studying the isotopic compositions of different groups of meteorites ...

There are eight planets in the solar system. The four inner terrestrial planets are Mercury, Venus, Earth, and Mars, all of which consist mainly of rock. The four outer planets are Jupiter, ...

The Solar System provides the only known example of a habitable planet, the only star we can observe close-up, and the only worlds we can visit with space probes. Solar System research is ...

Restore the solar system

Restore the true scale of the solar system, Southeast Asia's leading anime, comics, and games (ACG) community where people can create, watch and share engaging videos.

Here, we recommend solar system exploration objectives for the decade and beyond in the context of current global developments in the field and research groups in India.

Our solar system includes the Sun, eight planets, five officially named dwarf planets, hundreds of moons, and thousands of asteroids and comets. Our solar system is located in the Milky ...
