

# Size of solar power generation on the roof

How do I know how much solar power my roof can generate?

At the end of the day, the easiest way to accurately determine how much solar power your roof can generate is to talk with installers. They design solar panel systems every day and will be able to assess your roof's unique features and provide you with a production estimate. Create your own clean energy with solar panels.

How many solar panels can fit on a roof?

To calculate how many panels can fit on your roof, divide your open roof space by 20 square feet (or however large your particular solar panels are). For example, if you have 500 square feet of open, available roof space, that's enough space for about 25 solar panels.

What is the minimum roof size for a 10kW Solar System?

This is a standard 10kW solar system, consisting of 25 400-watt solar panels. As we will see in the summarized chart below, the minimal roof size for a 10kW system is only 800 sq ft roof area (600 sq ft viable for solar panels due to 75% code consideration)

How much solar power can a 2000 sq ft roof generate?

Let's take a big 2000 sq ft roof as an example. Such a big roof has 1500 sq ft of viable solar panel area. If each of these viable square feet generates 17.25 watts of electricity, the combined 1500 sq ft will be able to generate more than 25kW per peak sun hour (25.875kW, to be exact).

With the solar rooftop calculator and this chart, you have two very useful tools to figure out what size solar system you can put on your roof and how many solar panels you will need for that.
