What is slot-die coating for perovskite solar devices?

As the ultimate goal of slot-die coating for perovskite solar devices is large-scale production and commercialization in the photovoltaic market, stability is of the greatest priority.

Do slot-die coated SnO₂ based perovskite solar devices perform better?

The performance of slot-die coated SnO₂-based perovskite solar devices is not only shown through the achievement of higher efficiencies but also the demonstration of a more consistent performance distribution compared to other n-i-p electron transport materials like TiO₂ and ZnO.

Are slot-die-based PSC publications crystallized for future scalable perovskite research?

Hence, in this review article, all 115 existing slot-die-based PSC publications to date together with related literature are crystallized to set stages for future scalable perovskite research. Through investigation of the effects of materials, processes, and structures on performance, stability, and cost of slot-die coating is presented.

What are flexible perovskite solar cells?

Flexible perovskite solar cells (FPSCs) have recently become a new wave in solar technology, offering exciting possibilities made viable by their unique properties. As the name may suggest, those properties allow for FPSCs to be bent, curved, or even rolled, making them ideal for a wider range of applications, unlike their rigid counterparts.

A prototype of the proposed photovoltaic cell slot-integrated antenna was fabricated and measured to verify the simulation results regarding the reflection coefficient and radiation properties.

The integration of slot antennas in a class of commercial photovoltaic (PV) panels is addressed. The basic idea is to exploit the room available between adjacent solar cells, also taking advantage of the ...

This paper presents a compact low-profile slot antenna integrated with a photovoltaic cell. The photovoltaic cell consists of a top metal grid, gallium arsenide substrate, and metallic...
