

In a groundbreaking development, scientists from Caltech have made significant strides toward achieving carbon-neutral aviation by creating a ...

Scientists at Caltech have unveiled a groundbreaking solar reactor that converts sunlight and carbon dioxide into sustainable aviation fuel (SAF), offering a ...

To help solve this problem, a research team from Caltech, working with the U.S. Department of Energy's Liquid Sunlight Alliance (LiSA), created a ...

To address this need, scientists have been working to devise a way to use sunlight to generate solar-thermal heating that could then drive the ...

US scientists have created solar-powered jet fuel, marking a major step toward carbon-neutral aviation and clean energy innovation.

Solar-powered aircraft are electric aircraft that can be an airplane, blimp, or airship and use either a battery or hydrogen to store the energy produced by the solar cells and use that energy at night when the sun isn't shining.

Researchers at Caltech recently devised a new solar -powered method for jet fuel production. By prompting the required chemical reactions ...

At Airbus, we are working to use this alternative renewable energy source to power high-endurance stratospheric flight. Our advances in solar cell technology ...

The team of researchers at ETH found that a solar-driven thermochemical method to split water and carbon dioxide using a metal oxide ...

Emerging technologies, such as organic solar cells and solar-powered drones, hold the potential to revolutionize the aviation industry and ...

Solar Jet Power Generation
