

The reverse action pressure switch is wired into the charge controller and will send a sensor pulse to either turn on the pump (if the pressure tank is asking for water) or turn the pump off (if the pressure ...

Check out diagrams of solar pump systems using reverse action pressure switches, use filter "Pressure Shut Off". Let us know if you have questions but they are really easy to install and wire!

What can we help you find? Was this article helpful?

The pressure switch that we use is called a Reverse Action Pressure Switch or RAPS, this means that the action that starts when the terminals connect is to turn the pump off.

1) A check valve is needed (usually installed at the pump) to maintain pressure in the line and allow for proper shut-off. 2) You'll need only one side of the reverse action pressure switch.

The RPS Solar Pump will get signal from the pressure switch and come on when the pressure drops (water being used) and off again when the pressure increases (valves are closed).

While some pump types can operate in reverse (and even rely on it), others absolutely should not. In this article, we'll break down the pump types, when reverse rotation is acceptable, and the risks of getting ...

In this tutorial, JNTech engineers demonstrate how to set forward and reverse rotation on a solar pump inverter, helping you quickly correct pump direction during installation or...

If you need your solar pump to shut off when your stock tank or storage tank is full, we recommend using a float valve, a reverse-action pressure switch and a check valve in order to use pressure as a signal to turn off your pump.

Solar water pump reverse
