What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatch and therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

What is a liquid air energy storage system?

An overview of this technology can be found in . It is also possible to store large amounts of energy at a smaller size than a CAES system with liquid air energy storage systems (LAES), which store liquid air (or liquid nitrogen) rather than compressed air.

Why do we need compressed air energy storage systems?

Conclusions With excellent storage duration, capacity, and power, compressed air energy storage systems enable the integration of renewable energy into future electrical grids. There has been a significant limit to the adoption rate of CAES due to its reliance on underground formations for storage.

How does a compressed air energy storage plant work?

In times of excess electricity on the grid (for instance due to the high power delivery at times when demand is low), a compressed air energy storage plant can compress air and store the compressed air in a cavern underground. At times when demand is high, the stored air can be released and the energy can be recuperated.
