

This paper presents a three-phase grid-connected photovoltaic system that implements a Neutral Point Clamped Inverter (NPC).

This paper proposes a fast power control strategy for grid-forming inverters: firstly, the active power control bandwidth is improved by a prefilter with leading characteristics; then, model ...

In this work, a double voltage vector model predictive control (DVV-MPC) algorithm for grid-connected cascade H-bridge (CHB) multilevel inverter is presented. The algorithm not only has ...

We propose a vector current control derived from direct power control (VCC-DPC) for a three-phase voltage source inverter (VSI) in the synchronous rotating frame through instantaneous real and ...

The optimal vector combination is determined through two value function optimizations within a single control cycle, followed by the selection of the most suitable vector combination ...

To further improve the current control accuracy of grid-connected inverters and reduce the current harmonic content, the three-vector model predictive control m

Comparing all the control techniques for single phase Grid connected inverters, the PLVC method can be implemented with only two PI controllers and an L filter.

In order to replicate the inertia, damping, and droop characteristics of conventional synchronous generators, grid-connected inverters are controlled by the application of virtual ...

The output optimal voltage vector combination is modulated to generate a PWM wave, which acts on the grid-connected inverter. Finally, the proposed three-vector model predictive control ...

-[10]. A standard control strategy of grid-connected VSI is vector current control (VCC), which is designed in a synchronous rotating reference frame. The main advantage is that it trans-forms the ...
