

# What is a turbo expander

A turboexpander is designed to extract energy from a process gas. High-pressure gas enters the expander case, passes through the expander nozzles where it is directed into the expander impeller, ...

Turbo expanders are one of the lesser known but most important components in gas-handling and pressurization systems. Turbo expanders work on one of the simplest of all natural laws to convert ...

A turboexpander is a rotating machine with an expansion turbine that converts the energy contained in a gas into mechanical work, much like a steam or gas turbine.

The term "Turboexpander", Figure 1, is normally used to define an Expander/Compressor machine as a single unit. It consists of two (2) primary components; the Radial Inflow Expansion ...

A turboexpander is a specialized turbine that converts high-pressure gas into mechanical work by spinning a wheel, a process that also causes a significant drop in the gas's temperature.

The structure is composed of three parts, namely, turbo-expander, turbo-compressor and shaft, which realizes the miniaturization of the equipment and saves the initial cost.

A turbo expander is a device that rapidly reduces the pressure of a high-pressure gas while extracting energy from it. It operates on the principles of thermodynamics, specifically expanding...

Combining compressor and expander functionalities to deliver a compact, efficient footprint. Compressors available with rated power up to 30MW, used in LNG and chemical applications.

A turboexpander, also referred to as a turbo-expander or an expansion turbine, is a centrifugal or axial-flow turbine, through which a high- pressure gas is expanded to produce work that is often used to ...
